

HiTOP to ICD-10-CM Crosswalk

Welcome! This HiTOP to ICD-10-CM crosswalk (“HiTOP-ICD crosswalk” for short) was developed to help clinicians using HiTOP-based assessments as they cross-reference to relevant ICD codes. Every element of the HiTOP model has the potential to be cross-walked to an ICD code or codes. We say “potential” since there is not a 1-to-1 correspondence between HiTOP and ICD-10-CM and since the below cross-walk has not been validated. As such, these are only possibilities based on the opinion of clinicians in HiTOP and are meant solely as a possible starting place for an ICD diagnosis. Ultimately, it is the responsibility of the clinician to determine whether a person meets criteria for a given ICD code.

How to use this document: After conducting a HiTOP-based assessment of symptoms, a clinician will have obtained a profile of the patient’s elevations on different HiTOP components, traits, syndromes, subfactors or spectra - depending on how detailed the assessment was and at what level of the HiTOP hierarchy it was conducted. For each elevated component, a clinician can use the cross-references below to help you identify ICD codes that may be relevant. Several options are given, and you may select the code that best fits the presenting symptoms. When multiple options are listed, selection can be guided by the most prominent symptoms. In cases where more than one symptom is prominent, multiple ICD-10-CM diagnoses may be given. The crosswalk operates at different levels of the HiTOP hierarchy. At the higher levels (spectra), suggested crosswalk ICD diagnoses tend to be less defined and less narrow, whereas they may be more specific at other levels.
